Troubleshoot SQL Imports in phpMyAdmin

Databases · https://support.jansma.vip/docs/vip-hosting/databases/how-do-i-import-a-sql-file-via-phpmyadmin-on-jansma-vip-hosting/

If an SQL import does not complete, identify whether the cause is the file, the target database or an upload and execution limit before retrying.

Read the error

Keep the exact non-sensitive error message and note where the import stopped. Common causes include unsupported syntax, duplicate objects, character-set issues, file-size limits and execution timeouts.

Validate the export

Confirm that the file is a valid SQL export for the database engine and version. Review destructive statements and create a backup before another attempt.

Use a safer retry

For large exports, split the file at logical boundaries or use a supported command-line or migration method when available. Do not repeat a partial import without checking which objects were already created.

Need help?

If the result differs from the steps above, contact Jansma VIP Support with the domain or service involved and any non-sensitive error details. Do not send passwords or secret keys.
