Use and Manage Jansma VIP CDN

CDN · https://support.jansma.vip/docs/vip-hosting/cdn/how-do-i-use-the-jansma-vip-cdn/

Jansma VIP CDN helps deliver eligible website assets from distributed edge locations. Once enabled for the correct hosting package, the service works automatically for supported traffic and usually requires no changes to your website code.

Enable the CDN

1. Sign in to your Jansma VIP Hosting workspace.
2. Open the hosting package for the website you want to accelerate.
3. Locate the CDN or Edge Caching controls.
4. Enable Edge Caching and save the setting.
5. Open the public website and test several pages and static files.

Activation is normally straightforward. The CDN begins storing eligible files as visitors request them; it does not need every file to be preloaded before the site can work.

Recommended checks after activation

- Confirm the domain points to the intended hosting package.
- Check the homepage, key landing pages, forms and account areas.
- Verify that images, fonts, stylesheets and scripts load correctly.
- Test from a private browser window to reduce local-cache confusion.
- Keep only one main page-caching strategy active.

Purge cached content

After deploying an important design, script or image change, use the purge control in the CDN or Edge Caching section. Purging removes stored edge copies; the next eligible request retrieves the current asset and creates a fresh copy automatically.

Temporarily disable the CDN

If you are diagnosing unusual behaviour, temporarily disable Edge Caching, clear the website application cache and test again. If the problem remains, it is unlikely to be caused by the CDN. Re-enable the service after the test so visitors continue to benefit from faster asset delivery.

Need help?

Contact Jansma VIP Support with the domain, the affected URL, the approximate time of your change and a short description of what you see. Include whether you already purged the CDN and tested in a private window.
