Create a MySQL Database

Databases · https://support.jansma.vip/docs/vip-hosting/databases/how-do-i-create-a-mysql-database-on-jansma-vip-hosting/

Create a separate database and user for each application where the hosting product supports custom databases. Managed WordPress products can restrict manual database creation.

Create the database

Sign in to the hosting control panel, open the package and select the MySQL database tool. Choose **Create database** and use a clear internal label.

Create secure access

Create or assign a database user with a unique strong password. Grant only the permissions required by the application and store the credentials securely.

Connect the application

Use the displayed database name, username and hostname in the application configuration. Test the connection before importing production data or changing DNS.

Need help?

If the result differs from the steps above, contact Jansma VIP Support with the domain or service involved and any non-sensitive error details. Do not send passwords or secret keys.
