Connect to a Microsoft SQL Database

Databases · https://support.jansma.vip/docs/vip-hosting/databases/how-do-i-manage-my-microsoft-sql-database-on-jansma-vip-hosting/

Use a compatible SQL Server client such as SQL Server Management Studio to administer an available Microsoft SQL database remotely.

Collect connection details

From the hosting control panel, copy the server hostname, port, database name and authorised username. Reset the password if it is not known.

Create the connection

In the client, select the appropriate SQL Server authentication method and enter the supplied values. Enable encryption where supported and required.

Troubleshoot access

Check spelling, firewall or IP restrictions, service availability and user permissions. Never expose SQL Server directly beyond the access model provided by the hosting platform.

Need help?

If the result differs from the steps above, contact Jansma VIP Support with the domain or service involved and any non-sensitive error details. Do not send passwords or secret keys.
