Check DNS Propagation

Domain Names · https://support.jansma.vip/docs/vip-hosting/domain-names/how-can-i-tell-if-dns-has-propagated-for-me/

DNS changes are not always visible everywhere at once because resolvers cache earlier answers until their time-to-live expires.

Check the authoritative value

Confirm the record in the DNS zone that is authoritative for the domain. If the nameservers are wrong, editing a different zone will have no effect.

Compare resolvers

Use a reputable DNS lookup service or system tool to query the record from more than one resolver. Compare the returned value with the intended destination.

Allow for caching

Propagation commonly completes progressively. Avoid repeatedly changing records while caches are updating, and verify both the root domain and any separate `www` record.

Need help?

If the result differs from the steps above, contact Jansma VIP Support with the domain or service involved and any non-sensitive error details. Do not send passwords or secret keys.
