PHP Extensions, ionCube and Restricted Functions

Programming & PHP · https://support.jansma.vip/docs/vip-hosting/programming-php/php-extensions-ioncube-and-restricted-functions/

Some applications depend on optional PHP extensions or functions. Jansma VIP Hosting enables features according to platform security and compatibility policies, so confirm requirements before deployment.

ionCube and extensions

Encoded commercial applications may require ionCube Loader. First verify that the application supports the selected PHP version, then check the hosting PHP configuration for the loader. If it is unavailable for that runtime, use a compatible application release or contact support before changing production.

Disabled functions

High-risk operating-system and process-control functions can be restricted on shared hosting. Do not attempt to bypass a disabled function. Ask the software vendor whether a supported alternative exists, move the task to an external service, or discuss a suitable isolated environment with Jansma VIP.

Diagnose compatibility

- Compare the application requirements with the active PHP version and extension list.
- Review logs without displaying technical errors to public visitors.
- Test one change at a time in staging.
- Keep application and dependencies supported and current.

Include the application version, required extension or function and exact non-sensitive error when contacting Jansma VIP Support.
